

Basic htaccess to help bootstrap:

RewriteEngine On

RewriteBase /

Canonicalize the hostname to a sans 'www' version - Flip logic if you want opposite.

RewriteCond %{HTTP_HOST} ^www\.(.*) [NC]

RewriteRule ^(.*)/?\$ http://%1/%1 [NC,L,R=301]

Canonicalize our urls by removing any trailing '/'s

RewriteRule ^(.*)/\$ \$1 [NC,L,R=301,QSA,NE]

Uncomment these lines to force a basic 'down page'

#RewriteCond %{REQUEST_URI} !/favicon.ico

#RewriteRule !^(js|img|css|fonts)/ down.html [NC,L,QSA]

Handle versioned media by removing the version, and bailing immediately:

RewriteRule ^([0-9]+)/?(js|img|css)/(.+)\$ /\$2/\$3 [NC,L,QSA]

Rewrite all non-resource requests through the bootstrap:

RewriteCond %{REQUEST_URI} !/favicon.ico

RewriteRule !^(js|img|css|fonts)/ index.php [NC,L,QSA]
