##
## Options for Apache web server for language specific web pages and to run
## Routino CGI scripts.
##

# The translated router pages use the MultiViews option to serve up a version of
# the web page depending on the client language preference.   If the line below
# is used in a .htaccess file like this one and the "AllowOverride none" option
# is set in the main Apache configuration file then the entry in the .htaccess
# file will not work.

#Options +MultiViews

# The English language option will be served if there is no other version
# present and no errors will be returned to the user in case of problems

LanguagePriority en
ForceLanguagePriority Prefer Fallback

# The Routino CGI scripts are stored in this directory and use the filename
# extension ".cgi".   This filename extension needs to be registered with Apache
# for the scripts to be executed.

AddHandler cgi-script .cgi

# The ExecCGI option must be set for the CGIs in this directory to be executed
# by Apache.   If the line below is used in a .htaccess file like this one and
# the "AllowOverride none" option is set in the main Apache configuration file
# then the entry in the .htaccess file will not work.

#Options +ExecCGI

# The CGI scripts that are used by Routino also call some other Perl scripts, to
# stop these scripts from being seen by web users they can be denied by the
# following entry.

<FilesMatch .*\.pl$>
    Order deny,allow
    Deny from all
</FilesMatch>
