

DirectoryIndex index.php

RewriteEngine On

RewriteBase /

<IfModule mod_rewrite.c>

Canonicalize codeigniter URLs

If your default controller is something other than

"welcome" you should probably change this

#RewriteRule ^(home(/index)?|index(\.php)?)/?\$ / [L,R=301]

#RewriteRule ^(.+)/index/?\$ \$1 [L,R=301]

Removes trailing slashes (prevents SEO duplicate content issues)

RewriteCond %{REQUEST_FILENAME} !-d

RewriteRule ^(.+)/\$ \$1 [L,R=301]

Enforce www

If you have subdomains, you can add them to

the list using the "|" (OR) regex operator

#RewriteCond %{HTTP_HOST} !^(www|subdomain) [NC]

#RewriteRule ^(.)\$ http://www.dodamp.com/\$1 [L,R=301]*

Enforce NO www

RewriteCond %{HTTP_HOST} ^www [NC]

RewriteRule ^(.*)\$ http://dodamp.com/\$1 [L,R=301]

###

Removes access to the system folder by users.

Additionally this will allow you to create a System.php controller,

previously this would not have been possible.

'system' can be replaced if you have renamed your system folder.

RewriteCond %{REQUEST_URI} ^system.*

RewriteRule ^(.*)\$ /index.php/\$1 [L]

Checks to see if the user is attempting to access a valid file,

such as an image or css document, if this isn't true it sends the

request to index.php

RewriteCond %{REQUEST_FILENAME} !-f

RewriteCond %{REQUEST_FILENAME} !-d

```
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond $1 !^(index\.php|robots\.txt)
RewriteRule ^(.*)$ index.php?/$1 [L]
```

```
</IfModule>
```

```
<IfModule !mod_rewrite.c>
```

```
# Without mod_rewrite, route 404's to the front controller
ErrorDocument 404 /index.php
```

```
</IfModule>
```
