#

## the following line is needed to allow Download-By-Redirect to work
Options +FollowSymLinks

#
# This is used with Apache WebServers
#
# The following blocks direct HTTP requests to all filetypes in this directory
recursively, except certain approved exceptions
# It also prevents the ability of any scripts to run. No type of script, be it PHP, PERL
or whatever, can normally be executed if ExecCGI is disabled.
# Will also prevent people from seeing what is in the dir. and any sub-directories
#
# For this to work, you must include either 'All' or at least: 'Limit' and 'Indexes'
parameters to the AllowOverride configuration in your apache/conf/httpd.conf file.
# Additionally, if you want the added protection offered by the OPTIONS directive below,
you'll need to add 'Options' to the AllowOverride list, if 'All' is not specified.
# Example:
<Directory "/usr/local/apache/htdocs">
# AllowOverride Limit Options Indexes
</Directory>
#####

# deny *everything*
<FilesMatch ".*">
Order Allow,Deny
Deny from all
</FilesMatch>

# but now allow just *certain* necessary files:
<FilesMatch ".*\.(zip|ZIP|pdf|PDF|mp3|MP3|swf|SWF|wm|WMA|wml|WMV)$">
Order Allow,Deny
Allow from all

# tell all downloads to automatically be treated as "save as" instead of launching in an
application directly.

```

application directly

```
# (just uncomment the next 2 lines by removing the '#');  
# ForceType application/octet-stream  
# Header set Content-Disposition attachment  
</FilesMatch>
```

IndexIgnore /*

NOTE: If you want even greater security to prevent hackers from running scripts in this folder, uncomment the following line (if your hosting company will allow you to use OPTIONS):

```
# OPTIONS -Indexes -ExecCGI
```
