DirectoryIndex index.php index.html index.shtml /ErrNotFound.asis

RewriteEngine On

Define variable for /Physik.FSPHY'S path

RewriteRule ^ - [E=site_dir:/Physik.FSPHYS]

Redirect www-muenster.de to uni-muenster.de because the former has no valid

HTTPS certificate

RewriteCond %{SERVER_NAME} =www-muenster.de [OR]

RewriteCond %{SERVER_NAME} =www.www-muenster.de

RewriteRule ^/?(.*)\$ https://www.uni-muenster.de%(ENV:site_dir)/\$1 [L,R=permanent]

Redirect HTTP to HTTPS

default: [R] = [R=302] ("Found"/"Moved Temporarily")

[R=permanent] = [R=301]: "Moved Permanently"

RewriteCond %{HTTPS} !=on

RewriteRule ^/?(.*)\$ https://%(SERVER_NAME)%(ENV:site_dir)/\$1 [L,R=permanent]

Redirect <...>/index.php, <...>/index.html, <...>/index.shtml to <...>/

RewriteRule ^(.*)/index\.(phpl?html)\$ %(ENV:site_dir)/\$1/ [L,R=permanent]

RewriteRule ^index\.(phpl?html)\$ %(ENV:site_dir)/ [L,R=permanent]

Redirect <...>.php, <...>.html, <...>.shtml to <...> (without file extension)

Only redirect if environment variable is set to avoid redirect loops

NOTE: Using the [END] flag instead of setting an environment variable is

better, but was first introduced in Apache 2.4!

NOTE: %(ENV:REDIRECT_redirected) etc. has to be checked because Apache (for

some reason) renames environment variables on redirect (this seems to be

undocumented); see

https://stackoverflow.com/q/3050444/595306

RewriteCond %(ENV:redirected) !=1

RewriteCond %(ENV:REDIRECT_redirected) !=1

RewriteCond %(ENV:REDIRECT_REDIRECT_redirected) !=1

RewriteCond %(ENV:REDIRECT_REDIRECT_REDIRECT_redirected) !=1

RewriteRule ^(.+)\.(phpl?html)\$ %(ENV:site_dir)/\$1 [L,R=permanent]

Alternative to the environment variable method: Look at %(THE_REQUEST)

(because this doesn't change even if the URL is rewritten)

Not sure how robust this is, though

https://stackoverflow.com/q/3050444/595306

```

#RewriteCond %{REQUEST_FILENAME} !-d
#RewriteRule ^ %1 [L,R]

# Find file with file extension .php, .html or .shtml on the filesystem for a URL
# without file extension
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond %{REQUEST_FILENAME} !-f
RewriteCond %{REQUEST_FILENAME}.php -f
RewriteRule ^ %{REQUEST_FILENAME}.php [L,E=redirected:1]
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond %{REQUEST_FILENAME} !-f
RewriteCond %{REQUEST_FILENAME}.html -f
RewriteRule ^ %{REQUEST_FILENAME}.html [L,E=redirected:1]
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond %{REQUEST_FILENAME} !-f
RewriteCond %{REQUEST_FILENAME}.shtml -f
RewriteRule ^ %{REQUEST_FILENAME}.shtml [L,E=redirected:1]

# Execute main page as PHP (necessary because its template must be a .html
# file, which will only generate files ending in .html); cf.
# https://www.uni-muenster.de/ZIV/Technik/WWW/WebSpaceKonfig.html
# Note: This sets PHP as the handler for ALL files called "index.html"
# in this directory's subdirectories - not sure how to avoid this without
# putting a .htaccess file in every subdirectory..
<Files "index.html">
    AddHandler php5-script .html
</Files>
