

RewriteEngine on

FOR DEVELOPMENT

*# Redirect all requests for non-existent files to /index.html. This is
easier for development, but it can cause the application to lock up in
some cases. (For example, if the app tries to load a non-existent HTML
template, then Apache will serve up a second copy of the app, which
will be nested inside the first... which can continue indefinitely until
you get a stack overflow.)*

Don't rewrite files or directories

```
RewriteCond %{REQUEST_FILENAME} -f [OR]
```

```
RewriteCond %{REQUEST_FILENAME} -d
```

```
RewriteRule ^ - [L]
```

Rewrite everything else to index.html to allow html5 state links

```
RewriteRule ^ index.html [L]
```

FOR PRODUCTION

*# To be on the safe side, it's better to explicitly allow those routes that
are actually used in your application, and let requests for other URLs 404
naturally.*

```
# RewriteRule ^example index.html
```
