# Apache Server Configs v2.5.0 | MIT License
# https://github.com/h5bp/server-configs-apache

# (!) Using `.htaccess` files slows down Apache, therefore, if you have access
# to the main server config file (usually called `httpd.conf`), you should add
# this logic there: http://httpd.apache.org/docs/current/howto/htaccess.html.

# Modified from
# https://raw.githubusercontent.com/h5bp/html5-boilerplate/master/.htaccess
# https://github.com/cakephp/cakephp/blob/master/.htaccess

#####
# # URL REWRITES #
# #####
# -----
# | Rewrite engine |
# -----

# Turning on the rewrite engine and enabling the `FollowSymLinks` option is
# necessary for the following directives to work.

# If your web host doesn't allow the `FollowSymLinks` option, you may need to
# comment it out and use `Options +SymLinksIfOwnerMatch` but, be aware of the
# performance impact: http://httpd.apache.org/docs/current/misc/perf-tuning.html#symlinks

# Also, some cloud hosting services require `RewriteBase` to be set:
# http://www.rackspace.com/knowledge_center/frequently-asked-question/why-is-mod-rewrite-
not-working-on-my-site
<IfModule mod_rewrite.c>
    Options +FollowSymLinks
    # Options +SymLinksIfOwnerMatch
    RewriteEngine On
    # RewriteBase /
</IfModule>

# -----
# | Pretty URLs |
# -----

# "Pretty URL" support - pushes all requests into index.php (assuming that asset does not
exist in webroot)
# # # # #

```

```
<!IfModule mod_rewrite.c>
  RewriteCond %{SCRIPT_FILENAME} !-d
  RewriteCond %{SCRIPT_FILENAME} !-f
  RewriteRule ^(.*)$ index.php [QSA,L]
</IfModule>
```
