

*# index.php rewriting, taken from symfony2.*

DirectoryIndex index.php

<IfModule mod\_rewrite.c>

RewriteEngine On

*# Determine the RewriteBase automatically and set it as environment variable.  
# If you are using Apache aliases to do mass virtual hosting or installed the  
# project in a subdirectory, the base path will be prepended to allow proper  
# resolution of the app.php file and to redirect to the correct URI. It will  
# work in environments without path prefix as well, providing a safe, one-size  
# fits all solution. But as you do not need it in this case, you can comment  
# the following 2 lines to eliminate the overhead.*

RewriteCond %{REQUEST\_URI}::\$1 ^(/.+)/(.\*):\2\$

RewriteRule ^(.\*) - [E=BASE:%1]

*# Redirect to URI without front controller to prevent duplicate content  
# (with and without `/app.php`). Only do this redirect on the initial  
# rewrite by Apache and not on subsequent cycles. Otherwise we would get an  
# endless redirect loop (request -> rewrite to front controller ->  
# redirect -> request -> ...).  
# So in case you get a "too many redirects" error or you always get redirected  
# to the startpage because your Apache does not expose the REDIRECT\_STATUS  
# environment variable, you have 2 choices:  
# - disable this feature by commenting the following 2 lines or  
# - use Apache >= 2.3.9 and replace all L flags by END flags and remove the  
# following RewriteCond (best solution)*

RewriteCond %{ENV:REDIRECT\_STATUS} ^\$

RewriteRule ^index\.php(\/(.\*)|)\$ %{ENV:BASE}/\$2 [R=301,L]

*# If the requested filename exists, simply serve it.  
# We only want to let Apache serve files and not directories.*

RewriteCond %{REQUEST\_FILENAME} -f

RewriteRule .? - [L]

*# Rewrite all other queries to the front controller.*

RewriteRule .? %{ENV:BASE}/index.php [L]
