

DirectoryIndex index.php

```
<IfModule mod_rewrite.c>
```

```
    RewriteEngine On
```

```
    # Redirect to URI without front controller to prevent duplicate content
    # (with and without `/app.php`). Only do this redirect on the initial
    # rewrite by Apache and not on subsequent cycles. Otherwise we would get an
    # endless redirect loop (request -> rewrite to front controller ->
    # redirect -> request -> ...).
    # So in case you get a "too many redirects" error or you always get redirected
    # to the startpage because your Apache does not expose the REDIRECT_STATUS
    # environment variable, you have 2 choices:
    # - disable this feature by commenting the following 2 lines or
    # - use Apache >= 2.3.9 and replace all L flags by END flags and remove the
    #   following RewriteCond (best solution)
```

```
RewriteCond %{ENV:REDIRECT_STATUS} ^$
```

```
RewriteRule ^index\.php(/(.*)|)$ %{CONTEXT_PREFIX}/$2 [R=301,L]
```

```
    # If the requested filename exists, simply serve it.
    # We only want to let Apache serve files and not directories.
```

```
RewriteCond %{REQUEST_FILENAME} -f
```

```
RewriteRule .? - [L]
```

```
    # The following rewrites all other queries to the front controller. The
    # condition ensures that if you are using Apache aliases to do mass virtual
    # hosting, the base path will be prepended to allow proper resolution of the
    # app.php file; it will work in non-aliased environments as well, providing
    # a safe, one-size fits all solution.
```

```
RewriteCond %{REQUEST_URI}::$1 ^(/.+)(.+)::\2$
```

```
RewriteRule ^(.*) - [E=BASE:%1]
```

```
RewriteRule .? %{ENV:BASE}index.php [L]
```

```
    # Order deny,allow
```

```
    # Deny from all
