# Determine the RewriteBase automatically and set it as environment variable. # If you are using Apache aliases to do mass virtual hosting or installed the # project in a subdirectory, the base path will be prepended to allow proper # resolution of the app.php file and to redirect to the correct URI. It will # work in environments without path prefix as well, providing a safe, one-size # fits all solution. But as you do not need it in this case, you can comment # the following 2 lines to eliminate the overhead. RewriteCond %(REQUEST\_URI):: \$1 ^(/.+)/(.\*):: \2\$ RewriteRule ^(.\*) - [E=BASE: %1]

```
# Redirect to URI without front controller to prevent duplicate content
# (with and without `/app.php`). Only do this redirect on the initial
# rewrite by Apache and not on subsequent cycles. Otherwise we would get an
# endless redirect loop (request -> rewrite to front controller ->
# redirect -> request -> ...).
# So in case you get a "too many redirects" error or you always get redirected
# to the startpage because your Apache does not expose the REDIRECT_STATUS
# environment variable, you have 2 choices:
# - disable this feature by commenting the following 2 lines or
# - use Apache >= 2.3.9 and replace all L flags by END flags and remove the
# following RewriteCond (best solution)
RewriteCond %(ENV: REDIRECT_STATUS) ^$
RewriteRule ^app\.php(/(.*)|$) %(ENV: BASE)/$2 [R=301,L]
# If the requested filename exists, simply serve it.
```

# We only want to let Apache serve files and not directories. RewriteCond %(REQUEST\_FILENAME) -f RewriteRule .? - [L] # kewrite all other queries to the front controller.
RewriteRule .? %(ENV: BASE)/app.php [L]
